

Base data

↔  
Independent  
samples

Target data

Data

- Summary statistics
- Betas/ORs weights in PRS calculation

- Individual-level genotype and phenotype data
- Often small sample size

Processing

### QC

- Both data sets QCed as standard in GWAS
- Some QC requires special care in PRS (e.g., sample overlap, relatedness and population structure)
- Retain set of SNPs that overlap between base and target data
